NATIVE OR NUISANCE? WHY WE CARE

NATIVE PLANTS

Native plants are best adapted for long-term success in local soils and growing conditions. Planted in the right location, they thrive with little or no maintenance, generally do not require fertilizers or pesticides, and do not require long-term irrigation.

Only native or locally-adapted plants should be planted in Sensitive Lands, including wetlands and stream corridors (RP Districts) and tree groves (RC Districts). Native plants may not be removed from these protected resource areas.

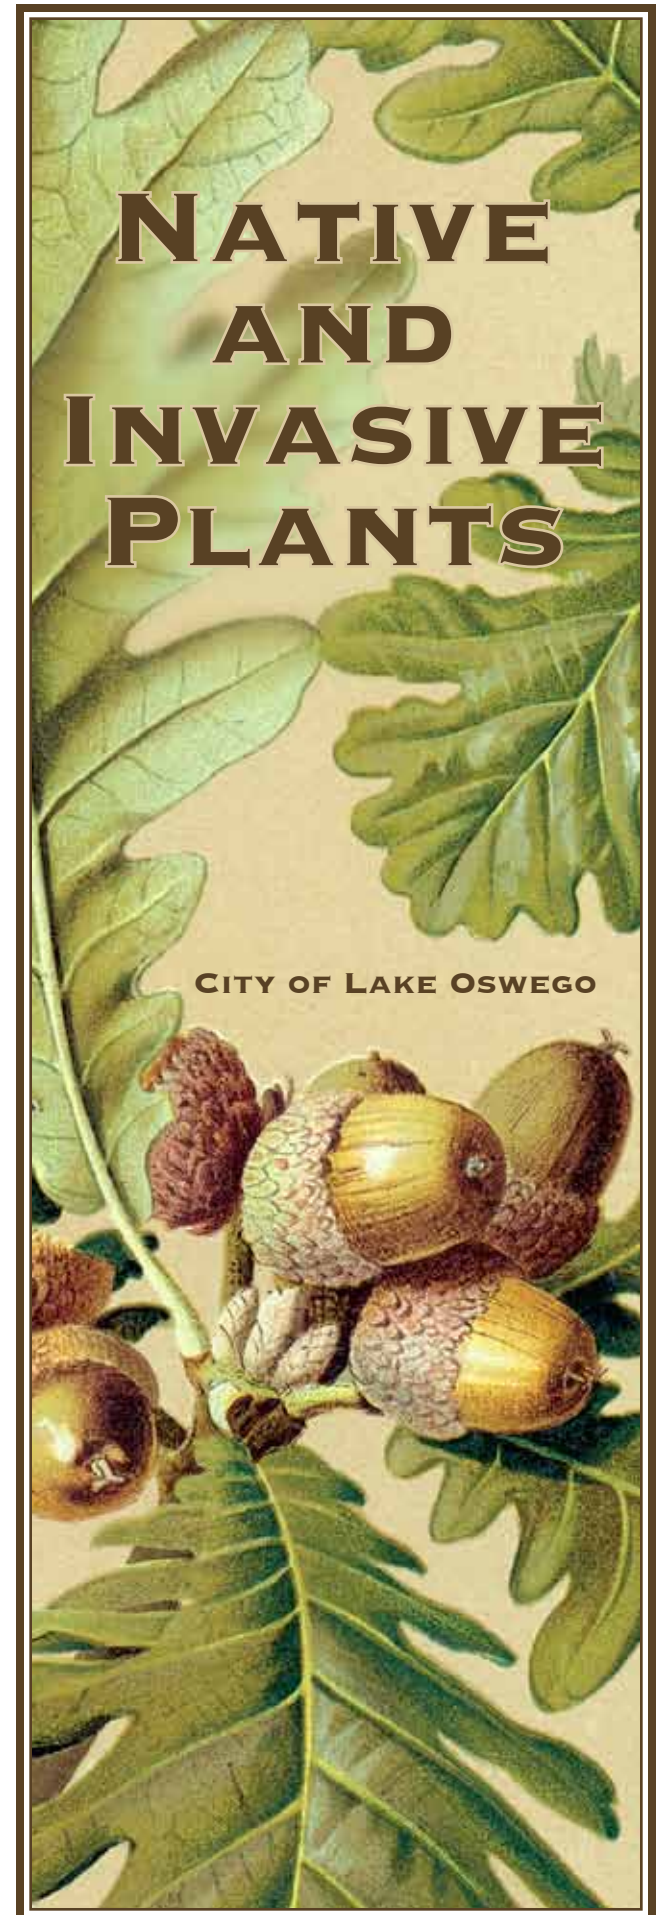

Every effort has been made to develop a complete list of native plants, but other native or naturalized plants may also be acceptable. The Planning Department is happy to assist with verifying other appropriate plants.

NUISANCE / INVASIVE

What's so bad about invasive plants? They crowd out native plants and don't provide much habitat for wildlife. They can change local ecosystems, resulting in lost diversity and an increase in soil erosion and disease.

Nuisance and invasive plants may not be planted in Sensitive Lands areas. (This limitation also applies to sub-species and cultivars.) However, these plants may be manually removed from any area, including resource areas; please contact the Planning Department for additional information.
